Please replace the Abstract with the following amended abstract:

ABSTRACT

Image display panel of the "top-emitting" OLED type ~~comprising~~
having, on the internal face of the front plate, which plate faces the
observer, an array of cavities or grooves that are distributed between the
light-emitting cells and contain an absorbent agent intended to absorb, in
particular, traces of oxygen and/or water ~~vapour~~ vapor liable to degrade
the organic electroluminescent cells. The lifetime of the panels is thereby
improved.
